Specifications

UNI EN 14411(ISO 13006) - Bla (Appendix G) UGL The fine porcelain stoneware tiles are manufactured using selected, extremely pure raw materials, submitted to the most advanced extraction and sorting techniques. The resulting product is a top-quality fine porcelain stoneware obtained by raw materials wet grinding, followed by partial drying by spraying, silo storage to allow homogenization of properties, and pressing by highly efficient hydraulic presses in order to achieve specific pressures of over 500 Kg/cm². High pressure values will result in a ceramic body obtained after suitable heat treatment at temperatures of about 1250°C, characterized by high compaction and strength with very low water absorption (lower than 0.1% according to UNI EN ISO 10545-3), extremely high mechanical strength (average value exceeding 50 N/mm² according to UNI EN ISO 10545-4). Fine porcelain stoneware, being a full body product, is characterized by a deep abrasion resistance (equal to 140 mm³ of removed material, as opposed to the 175 mm³ provided for by the UNI EN ISO 10545-6 standard); for this reason it is particularly suitable for heavy-traffic floors. Because of its low porosity, this product is frost-proof and rated as belonging to the Bla (UGL) class according to the UNI EN 14411 European Standard (water absorption being lower than 0.5%). Chemical acid and base resistance (UNI EN ISO 10545-13) makes porcelain stoneware items particularly suitable also for environments where aggressive products are used, such as chemicals, e.g. food processing factories, hospitals, chemical or pharmaceutical plants.
