The Composite Stone

About the Material...

With the term **Composite Stone** we refer to a technical material obtained by crushing natural stone (present in the finished product in a percentage greater than 90%), subsequently amalgamated with polymeric adhesives, in order to obtain a stone that is in all respects "*reconstituted*". To limit the serious problem of the onset of silicosis, we use raw materials without silica, maintaining the quality of the product unchanged, but at the same time protecting the health of workers.

Composite stone allows us to offer a wide range of proposals, both in terms of color and grain size, through the choice of raw materials and the introduction of color additives for the support or by varying the nature of the integrated conglomerates. The great versatility of the material also makes it perfect for customized solutions, developed in close contact with the customer.

The final product, through the engineering phase, is more homogeneous in its technical characteristics compared to the starting natural stone, guaranteeing a long life thanks to the resistance to impacts and scratches and a lower maintenance cost, not requiring particular treatments over time.

the Stone
as You Want it

NOUGAT

About the Series...

The **Nougat** series takes advantage of the versatility of composite stone to offer our customers a wide range of customized proposals and solutions. Thanks to the careful selection of raw materials and the addition of additives during the production process, we are able to provide you with a product that can adapt to your needs, varying colors, compositions and finishes.

The typical "*Terrazzo*" surfaces of **Nougat** can be integrated into your environments in a synergic and versatile way, adapting to floors and walls. Whether you want a mosaic decoration that stands out as a particular accent or you prefer to place our series at the center of your project, we will be able to develop the ideal solution for you.

The quality of the product and the ever-expanding range will guarantee you a material with a strong expressive character which, whether in the form of flooring or mosaic, can evolve in step with your desires.

TECHNICAL DETAILS

*Installation
and Maintenance*

COMPOSITE STONE

Installation and Maintenance

Any product to come in contact with the tiles must not be acidic, pigmented or abrasive.

Terrazzo Composite Stone is a special polyester resin tile, with natural stones selected chips.

Its resistance to abrasion flexion and impact make it the ideal material for large surfaces.

Choose a contractor that is experienced with the installation of Terrazzo Composite Stone and that they are given this information prior to proceeding.

Installation Procedure

Prepare the surface/products: the material has shade variation, so the products must be mixed randomly prior to installation. Products must be clean and free from dust.

Lay the products: using a notched trowel apply flexible adhesive then allow adhesive to dry for 24 hrs.

Treat the products with pre-grouting agent: with a paintbrush apply pre-grout protection, ensuring all surface is covered then let products to dry for 24 hours.

Grout the products: use point grout method of grouting we do not recommend the use of dark coloured grouts with light products.

Clean the products: with non-scratch white pad. Rinse with clean water then allow products to dry for 24 hrs. Please do not proceed to seal the products until they are fully clean & dry. Seal the products: using paint brush/fleece pad or other appropriate applicator, apply a generous application of sealant, ensuring surface of products & grout is fully covered. apply a 2nd coating (wet on wet) within 20 minutes of first application. Products can be walked on after 2 hours but product is not fully cured until 24 hours.

Test the products: after 24 hrs, carry out a bead test by placing a few drops of water onto the products, the droplets of water should sit on top and should not be absorbed into the products for at least 2 hours. If the products are absorbing the water, apply another coat.

General Maintenance

Maintain your products: we recommend you carry out regular bead tests on your products to confirm sealing properties are still active, and if not, we recommend you carry out a re-seal, we recommend only pH neutral products are used.

Cutting

We recommend that either a high-quality diamond cutter or an angle grinder is used to cut honed marble/terrazzo products. The cutting blade should be water suppressed to control dust and cool the blades. Whilst cutting or drilling products, the surface of the product may become wet and/or dirty. Wipe the product clean immediately after cutting.
